NEUROLOGY OUTPATIENT CLINICAL REPORT

Memory Disorders Evaluation

Patient ID	HS-ALZ-TEST-001	Visit Date	18 Aug 2026
Age	72 years	Sex	Female
Education	16 years	Referral	Progressive memory difficulty

Document status: Synthetic clinical-style document created only for HealthSense AI testing. It does not describe a real person.

1. Chief Complaint

Progressive short-term memory difficulty for approximately 2 years, with increasing difficulty managing appointments, finances, and recently learned information.

2. History of Present Illness

The patient and her daughter report gradual worsening of recent memory beginning around 2024. She frequently repeats questions, misplaces household objects, forgets recent conversations, and occasionally misses scheduled appointments. She remains independent with basic activities of daily living but requires assistance with online banking and medication organization. No abrupt onset, head injury, seizure, or focal neurological event is reported.

3. Medical History

Hypertension, hyperlipidemia, and osteoarthritis. No previous stroke or known neurological disease.

4. Current Medications

Medication	Dose / Schedule	Indication
Amlodipine	5 mg once daily	Hypertension
Atorvastatin	20 mg nightly	Hyperlipidemia
Acetaminophen	500 mg as needed	Osteoarthritis pain

5. Neurological Examination

Alert and cooperative. Oriented to person and place; required prompting for the exact date. Speech fluent with mild word-finding pauses. Cranial nerves grossly intact. No resting tremor. Strength 5/5 in all extremities. Gait stable without freezing or postural instability.

6. Cognitive Assessment

Assessment	Result	Comment
MMSE	23 / 30	Errors in orientation, delayed recall and serial subtraction
MoCA	19 / 30	Impaired delayed recall, executive function and attention
CDR	1	Mild dementia range
ADAS-Cog	18 / 70	Cognitive impairment present
FAQ	10 / 30	Reduced instrumental functional independence

7. Laboratory Results

Test	Result	Comment
Vitamin B12	486 pg/mL	Within expected range
TSH	2.1 mIU/L	Within expected range
Folate	12.4 ng/mL	Within expected range
HbA1c	5.8 %	No diagnostic diabetes range
CBC	Unremarkable	No major abnormality reported

8. Brain Imaging

MRI Brain: Mild-to-moderate generalized cerebral volume loss with greater prominence in the medial temporal regions bilaterally. No acute infarct, hemorrhage, or mass lesion. Mild chronic small-vessel ischemic change.

Imaging source page: 2

9. Clinical Impression

Progressive amnestic cognitive impairment with impairment in instrumental activities of daily living. The clinical pattern and cognitive testing are concerning for an Alzheimer-type neurocognitive disorder. Specialist correlation and biomarkers may be considered where clinically appropriate.

10. Assessment Summary

Domain	Finding
Memory	Prominent recent-memory impairment and impaired delayed recall
Executive function	Reduced attention, organization and serial calculation
Language	Mild word-finding difficulty
Motor	No prominent parkinsonian signs
Imaging	Medial temporal-predominant atrophy; mild small-vessel disease
Function	Basic ADLs preserved; assistance needed for selected IADLs

11. Plan / Recommendations

Continue neurological follow-up. Review medication adherence and safety. Consider formal neuropsychological follow-up and biomarker testing if clinically indicated. Discuss cognitive-support strategies and caregiver involvement.

12. Information Not Available

Amyloid PET: not available. CSF amyloid/tau biomarkers: not available. APOE genotype: not available. ADAS subtest-level scores: not available.

Testing expectation: disease_context = **alzheimers**. The report intentionally contains ADNI-compatible fields; the system must use only values actually present.
